

TrinityTrend: Trend Strength Candles, SuperTrend Squeeze

Overview

The **TrinityTrend** script is designed to measure market momentum and direction using multiple approaches:

- **Price Change** (raw relative movement)
- **EMA Slope** (direction of smoothed price trends)
- **MA Distance** (relationship between fast- and slow-moving averages)

These scores are normalized into a **Trend Strength Index (-100 to +100)** and color-coded directly on candles.

Strong bullish/bearish states stand out visually, while neutral states are greyed out.

In addition, the script overlays a **SuperTrend filter**, which provides trend confirmation and helps avoid false signals.

The script also includes a **TTM squeeze setup** with Bollinger Bands and Keltner Channels.

The Squeeze indicator settings are automatically configured for the various modes.

Both the TrendStrength logic and the SuperTrend can be run in different time-horizon modes.

Modes & Use Cases

◆ Intraday Mode

- **Purpose:** Quick reaction, short-term trading (scalps, day trades).
- **Settings:** Short lookbacks, fast EMAs, ATR (10).
- **Use Case:** Identifies intraday momentum bursts and quick reversals.
- **MA Preference:** EMA/EMA — fast and responsive for short-term moves.
- **Squeeze Indicator:** Bollinger and KC are set to default.

◆ Swing Mode

- **Purpose:** Multi-day to multi-week trades.
- **Settings:** Medium lookbacks, smoother EMAs, ATR (14).
- **Use Case:** Helps capture sustained trends while filtering noise.
- **MA Preference:** EMA/EMA or EMA/SMA — balances responsiveness with stability.

- **Squeeze Indicator:** Bollinger and KC are set to default.
-

◆ **Macro Mode**

- **Purpose:** Position trades, long-term investors, weekly/daily chart context.
 - **Settings:** Longer lookbacks, ATR (20), slow EMA and SMA pairs.
 - **Use Case:** Tracks primary trend direction (e.g., bull vs bear market phases).
 - **MA Preference:** SMA/SMA — the classic institutional choice (50/200 cross).
 - **Squeeze Indicator:** Bollinger is set to 30, 2.5. KC is set to 30, 1.8.
-

◆ **Extended Macro Mode**

- **Purpose:** Secular, institutional perspective — multi-quarter to multi-year.
 - **Settings:** Very long lookbacks, ATR (50), deep normalization (500 bars).
 - **Use Case:** Provides a “big picture” filter to stay aligned with long-term cycles.
 - **MA Preference:** SMA/SMA with very long terms (100/300, 200/500) — these are widely followed by funds, ETFs, and pensions.
 - **Squeeze Indicator:** Bollinger is set to 50, 3.0. KC is set to 50, 2.0.
-

SuperTrend Overlay

The script includes an independent **SuperTrend filter**, which can be set to the same or a different mode than TrendStrength.

- **Intraday SuperTrend:** good for lower time frames.
 - Factor is set to 1.0 and ATR 10.
- **Swing SuperTrend:** good for daily to multi-week time frame.
 - Factor is set to 1.5 and ATR 14.
- **Macro SuperTrend:** good for monthly time frame.
 - Factor is set to 2.0 and ATR 21.
- **Extended Macro SuperTrend:** acts as a secular bias filter (don't trade against it).

By separating TrendStrength mode from SuperTrend mode, a trader can **mix short-term signals with long-term bias** (e.g., Intraday candles inside an Extended Macro uptrend).
